To many people, when you say "wiki", what comes to mind is "Wikipedia", since this is probably the most well-known wiki on the Internet. Wikipedia is great, but the MediaWiki software that powers it isn't the best solution for every wiki website, especially for what might be called a "wiki plus" (see https://www.mediawiki.org/wiki/Manual:What_is_MediaWiki%3F#Some_things_MediaWiki_doesn.27t_do_so_well...). And, unlike Mediawiki sites, Tikipedia on Tiki implements responsive web design - a single HTML page for all device sizes - so there's no need for a separate mobile site. For websites where the well-known Wikipedia layout and appearance would be appropriate, but that need more features and power than MediaWiki provides, the Tikipedia theme is now available for Tiki Wiki CMS Groupware.

Not every detail is identical. Low-level template file customization and so on was avoided in order to
ensure continuing compatibility with the Tiki software and easy version updates. But overall the visual similarity is pretty close.

MediaWiki site administrators and editors will find that Tiki uses some different wiki syntax and page elements, so there will be a bit of a learning curve. There is a migration script to bring MediaWiki content into a Tiki site, available since Tiki 4, but current functionality should be checked.

Beyond the wiki, Tiki of course has a range of other features including blogs, galleries, "tracker" database functionality, and so on, so a Tikipedia site will really be a "wiki plus".

**Theme installation**

As with other "add-on" themes, just put the unzipped Tikipedia directory into the *themes* directory. Directory access permissions (chmod) may need to be set similar to those of the other theme directories. Then reload `tiki-admin.php?page=look`, to find Tikipedia in the list of available themes.

**Site configuration (for a Wikipedia-like layout)**

- "Fixed width" should not be activated, since MediaWiki sites are the full width of the browser window.
- Layout templates (Look and Feel Admin - `tiki-admin.php?page=look`)
  - Basic Bootstrap - works as expected
    (The "conventional" layout templates - that is, those that don't have a fixed top navbar - all work with this theme but look the same since the left and main column widths are hard-coded to replicate the Wikipedia page.)
  - Classic Tiki - works as expected
  - Fixed top navbar 1 - works in the sense that the page isn't broken but, as of this writing, there has been no testing or special CSS configured regarding the top navbar.
  - Wider side columns - works as
Fixed top navbar 2 - works, although the navbar menu appearance doesn't conform so much to the Wikipedia look.

- Wiki settings
  - On the wiki admin page (tiki-admin.php?page=wiki), these configuration settings are made:
    - Wiki action bar location = top
    - Wiki navigation bar location = top

- Module settings (tiki-admin_modules.php)
  - "Top" module zone - empty (contains no modules).
  - "Left" module zone - the logo module is in the top position.
  - "Topbar" module zone
    - The horizontal menu (navbar) should be assigned with these parameters:
      - type = horiz
      - navbar_toggle = y
      - navbar_brand= (path to site icon - no leading forward slash)
      - nobox = y
      - topclass ("Containing class") = tikipedia_menu (positioning of the menu, etc. is handled via this CSS class).
    - The menu should be Bootstrap type, to be properly responsive in small displays. However, this means any menuSection0 links (top-level "parent" items) are used only to show and hide their child links rather than for navigation, so the menu should be designed accordingly - note the example on this site.
  - Log in module, with these parameters:
Technical notes

Absolute positioning is used to place the menu (class="tikipedia_menu") at the bottom of the topbar module zone. The other modules in the topbar zone are configured normally except for being floated right, to reflect the MediaWiki positioning.

This theme doesn't try to replicate every MediaWiki Vector theme page detail - a balance was struck between similar appearance and ease of maintaining the theme. No Smarty template changes were made; Tikipedia uses only CSS and standard Tiki site configuration to attain this layout and appearance.

If adapted from another theme...
About the "infobox"

The "infobox" code will work to make a box in any theme, but there's an .infobox class in Tikipedia's CSS file that styles the box and its contents to match the MediaWiki infobox:

```css
.infobox {
  border: 1px solid #aaa;
  border-spacing: 3px;
  background-color: #f9f9f9;
  color: black;
  margin: 0.5em 0 0.5em 1em;
  padding: 0.2em;
  font-size: 88%;
  line-height: 1.5em;
}
.infobox img {
  margin-top: 6px;
}
.infobox h3, .infobox h4 {
  font-weight: bold;
  background-color: #c0c0c0;
  padding: 4px;
  text-align: center;
  font-family: sans-serif;
  margin: 0;
}
.infobox h3 {
  font-size: 120%;
}
.infobox h4 {
  font-size: 105%;
}
```
The details should be adjusted as needed to match the appearance of the theme. The box should be inside a div with Bootstrap grid and positioning classes, etc. to be less than full width.
